

Check the code In the **memo2question** folder and tell what is wrong with the code in App.js? Fix the code.

Note: You can not change the existing useState or add more **useState** to the code. And you can not use **useEffect**

When you use the `useMemo` hook, it helps prevent the recreation of the memoized value. This will save memory resources.

If the dependencies provided in the dependency array (the second argument of `useMemo`) have not changed since the last render, React will reuse the previously memoized(cached) result instead of recomputing it.

`useMemo` returns a value.
